<b>Edited publication and publication date</b>	14 June 2019
<b>Title of the Application</b>	Increasing Hybrid Seed Production through Higher Outcrossing Rate in Cytoplasmic Male Sterile Rice and Related Materials and Methods (hereinafter “1 <sup>st</sup> HO PCT”)
<b>Application Date</b>	05 June 2016
<b>Application Number</b>	PCT/IB2016/053294
<b>Publication Number</b>	WO 2016/193953 A1
<b>Publication Date</b>	08 December 2016

**BRIEF BACKGROUND**

The “High Outcross” (HO) trait responsible for increasing hybrid rice seed production has the potential to reduce the cost of hybrid rice seeds, and allow smallholder farmers’ access to more affordable hybrid rice varieties. The HO trait found in the wild relative *Oryza longistaminata* was successfully introduced into cultivated rice. Rice female lines containing the HO trait showed a strong increase in hybrid rice seed production.

This innovation was the basis for the 1<sup>st</sup> PCT HO application filed by IRRI in 2016.

## CURRENT STATUS

Nine (9) National Phase applications were derived from this 1<sup>st</sup> HO PCT application.

04/01/2018	Vietnam	1-2018-00038	N/A	N/A	N/A	Decision to discontinue on 03/12/2018

In December 2018, it was decided to discontinue the patent application in Vietnam, based on an analysis of the hybrid rice seed market in Vietnam (most hybrid rice seeds used in Vietnam are imported from India), and a review of the (cost/benefit) ratio of the Vietnam patent application.

IRRI scientists continue to work actively on the HO trait, to better understand and characterize the mechanisms involved, and to produce new elite parental lines with the non-GM HO trait.

Furthermore, IRRI, as a non-profit international organization, promotes responsible technology transfer and intellectual property management in accordance with its Intellectual Property and Commercialization Policy (IP&C Policy)<sup>1</sup> and with the CGIAR Principles on the Management of Intellectual Assets (“IA Principles”)<sup>2</sup>.
